Enhancing Your Learning, Writing and Thinking with Graphic Organisers

In a nutshell:
Graphic organisers, such as mind maps, tables and flowcharts, help you to better organise your thinking, content knowledge, and work processes, and thus help improve your efficiency, effectiveness and learning.

1. The Types and Uses of Graphic Organisers: “Choosing the Right Tool for the Job”

Just as a carpenter needs to have more than just a hammer in his or her toolbox, learners and thinkers need to have more than one type of graphic organiser approach in their “learning toolbox”. The table below gives a quick overview of the different types of graphic organisers discussed in these notes and gives an indication as to what sorts of tasks each is good for. The rest of these notes explores each of the tools in more depth. Note that as with any tool, it can take some practice to become reasonably proficient with its use, but it is worth the effort! And of course, you can adapt any of these tools to suit your individual purposes and ways of thinking.

Graphic organisers can be created using paper and pencil, an approach which has the greatest flexibility, but this approach can be impractically time consuming to revise if you don’t get the basic structure right on your first attempt. Consequently, it is useful to use some appropriate software. While generic programs like Microsoft Word, PowerPoint and Publisher can be used, and again used quite flexibly (see for example, the topic analysis map on p. 4), because basic tasks are not automated, they too can be quite time consuming to use. Hence, for speed and ease of use,
Dedicated mind or concept mapping software is worth using. Some good software products for mind/concept/argument mapping are:

- CompendiumNG
- FreeMind
- XMind
- VUE
- CmapTools
- Nodescape (Android)
- Inspiration
- Rationale

While a more comprehensive list of freeware and commercial software products can be found on Wikipedia (http://en.wikipedia.org/wiki/List_of_concept_mapping_software) and general internet searches.

2. Topic Analysis Mind Map

Academic writing can be thought of as being a collection of paragraphs which answer the questions an interested and critical thinking target reader would have about the topic of your writing (or alternatively, the sequence of questions you need answers to in order to come up with an overall answer to your overarching research question). For complex topics, a mind map as shown below provides a structured process for generating such focus questions to guide your research, reading, note-taking and writing. Note that such a map is just a starting place; as you learn things, you will most likely need to add questions to the map. Making the effort to develop focus questions will generally lead to deeper, more analytical thinking and better organised writing than would be the case if you see your job as just collating interesting things you find in the literature. Maps like these can also be created after you have done research as a way of organising what you have found.

Developing a topic analysis mind map:
1. First identify your overarching question or research prompt, stating it as clearly and as comprehensively as you can.
2. Put your question in the middle of a piece of paper in landscape format.
3. Underline all the key terms / concepts / task words in your question.
4. What questions follow from each of these key terms and your question as a whole? (These don’t have to be tackled in any particular order, which is one of the advantages of mind maps.)
5. What follow-on questions are there for each of these? E.g.:
   a. problems → solutions
   b. What? → Why? How? (Dig deeper and think critically!!)
6. Also look for links between questions.
7. It may be necessary to rework your map a couple of times to work out the best organisational structure, and this is where dedicated mind mapping software* is very useful.

How can we more effectively manage the incidence of type 2 diabetes amongst Indigenous Australians living in rural and remote communities?

* Note however, that dedicated mind mapping software won’t allow you to underline key words, you’ll just have to imagine doing this. (The map above was created using Microsoft Publisher, which while very versatile, is painfully slow for producing mind maps.)
Developing focus questions
To get going, try the classic question stems:
- Who?
- What?
- When / where / under what circumstances / to what extent?
- Why?
- How? How much? What’s the best way?

Try for various levels of Bloom’s Taxonomy:
- Remembering
- Understanding
- Applying
- Analysing
- Evaluating
- Creating

This example illustrates the importance of thinking about the questions your hypothetical real world target audience would have about the topic. In this case, the target audience might be business managers who are interested in getting the most out of their teams and avoiding problems! Hence, such readers would want answers to these questions.

Diversity: Help or hindrance to group performance?
What sorts of diversity can affect group performance?
How do different types of diversity affect group performance?
What sorts of diversity can help and why?
What sorts of diversity can hinder and why?
What other factors affect group performance and how does diversity interact with these factors?

What can be done to optimise potential positives?
What can be done to prevent / reduce potential negative impacts?

Why is this question important and who is it important to?

This is a generic question which should always be asked. It should be answered in the introduction as it provides the motivation for the remainder of the essay or report. The answers to this question will also help you to think more critically and analytically about your topic.
The media would have us believe that academic dishonesty amongst university students is rife and increasing at alarming rates.

Why do students plagiarise in assignments?
Why do students cheat on exams?
What forms of dishonesty are most common?
Why does it matter? What are the potential “costs” of not doing anything?

How common is it actually?
Does prevalence depend on any demographic variables?
- Year level?
- Discipline?
- Gender?
- Domestic / International Student?
- Tertiary entrance rank?
- ...

What are the trends?
What factors might be influencing the trends?
What can be done to reverse the trends / reduce the prevalence?

What are the strengths / weaknesses of different approaches?
Do these factors influence cheating in exams and plagiarism in assignments in different ways?

Can other programs be successfully transplanted here?
What can we learn from programs in other jurisdictions?
Is anyone doing better than us under similar circumstances?

This example illustrates a topic analysis mind map centred on a research prompt (an interesting observation) rather than a research question.
3. Note-Taking Mind Map

It can be quite overwhelming trying to turn the notes taken from several articles on a topic into a coherent and cohesive essay. However, just as first organising the pieces of a jigsaw puzzle into piles of related pieces (i.e. edge pieces and colours) greatly simplifies the task of putting a jigsaw puzzle together, so too your writing of an assignment can be greatly facilitated by first organising brief notes on the assignment topic thematically using a mind map as shown in the next couple of examples.
You might even find it useful to take notes on a single article using a mind map as the next example illustrates.

4. Knowledge Mind Map

Mind maps can also be used to thematically organise a body of knowledge as shown below for some material on learning. Such maps can be used to aid the learning of certain types of course content, and for getting your thoughts organised before you start writing (I use such maps frequently when organising the content for a new workshop). Organising knowledge in this way creates cues for recall, provides a structure for retrieval practice, and may help you see connections between different pieces of knowledge.

Notes
1. Note that each branch represents a major theme of the body of work, with sub-branches capturing major sub-points of each theme and then sub-sub-points. Thus a mind map organises information thematically and hierarchically.
2. Mind maps can be created with paper and pencil, but if you’re inexperienced and don’t get things basically right first go, revising can be too time consuming and so investigating some dedicated software (see p. 2) might be a more efficient way to go.
3. A mind map in the form below simply organises content thematically and hierarchically without identifying the conceptual / logical connection between elements of knowledge. To do the latter, a concept map is a better approach (see p. 10).
4. Note that to learn a body of material, creating a mind map can be very helpful, but by itself it is not enough, you still need to test yourself on all the things you will need to be able to demonstrate in an exam or in the workplace (as indicated on the mind map!).
5. For maps you create for yourself, you may need fewer words than on the map shown as the words on your map only have to cue recall of things you read in an article, but the map shown was created to be comprehensible without your having read the background articles.

D.R. Rowland, Student Services, The University of Queensland
5. Concept Maps

The construction of a mind map can be likened to the strategy of sorting the pieces of a jigsaw puzzle into different categories, like edge pieces and pieces of particular colours. While this kind of map can be very useful, the only logical structure it indicates is that of themes and sub-themes, and sometimes you want more than that. For example, when mapping out a body of theory, it is important to know what the logical connections are between concepts on the map, and this is achieved with a concept map.¹

A possible process for creating a concept map:

1. Brainstorm concepts related to an overarching concept (for the next example, this is the concept of “academic argument”). It is helpful to do this first step by hand, spreading related concepts out across a sheet of paper (see example below) to facilitate the next step. (I.e. a vertical list would make it hard to do the next step.)

2. Without worrying about what the overall structure would be, start pencilling in arrows connecting different concepts to start building up ideas on how to organise the map. Doing this may also trigger some thoughts on more concepts to add.

3. Allow for a period of gestation to get ideas on how the map might go together. (Some mental rehearsal while stuck in traffic and while walking from my car to my office in the morning helped get the process started for the “argument” concept map.)

4. Decide on how to get the map started and then “follow your nose” (i.e. just keep thinking: What’s the next concept linked to the current one?)

5. After finishing a first draft, continue to add concepts and links as more come to mind.
   - Note that on the map, concepts occur at nodes in the map while the relationship between concepts is indicated on the links. Two concepts and their link produce a unit of meaning. Extra explanations can go in side boxes or in hyperlinks if working electronically.
   - Also:
     a. Start with the overarching concept at the top.
     b. Move to major organising sub-concepts/themes.
     c. Then to detailed concepts and examples.

Initial thoughts on a concept map on the idea of argument in academic writing.

A map of concepts related to the idea of argument in academic writing.
Concept maps are hard work to create, so why bother? Well recall The Thinker on page one of these notes. Which knowledge state do you think lends itself to more effective thinking and problem solving in a domain of knowledge? Note however, that simply creating a concept map won’t by itself make you a master of the discipline or a master problem solver, you have to work with the map extensively in solving a range of problems in order to internalise the map.

Note that software often allows a user to collapse or expand side notes and even branches of a concept map or mind map.
6. Argument Maps

It is very easy to make incomplete and invalid arguments, and “argument mapping” is one technique for making sure you have complete and rigorous arguments. To learn the details of the technique, see:

- the argument mapping tutorial at: [http://austhink.com/reason/tutorials/index.htm](http://austhink.com/reason/tutorials/index.htm); and

Before looking at a couple of examples though, it will be helpful to first provide a definition for what an *argument* is in academic writing (see also the concept map on p. 11).

**In a nutshell:** An argument is a claim, contention or proposition together with the set of reasons and evidence put forward to support that claim, contention or proposition.

Complex arguments can also include objections and rebuttals, each of which are themselves arguments, that is, claims with supporting evidence and reasoning. Note however, that there does not need to be any disagreement about the evidence and reasoning for a writer to present an argument.

Since the justified answer to a question constitutes an argument, framing your writing around you and your target readers’ questions is an effective approach to developing arguments.

As a simple example of the technique, consider the argument that “Current approaches to science teaching mustn’t be any good at bringing students on as rational thinkers as Science students score no higher than Arts students on tests of critical thinking.” The argument map would be:

```
Current approaches to science teaching don’t bring students on as rational thinkers.

because

Science students score no higher than Arts students on tests of critical thinking.

and

Arts courses don’t bring students on as critical thinkers.

but

Arts courses also aim to develop students’ ability to think critically about evidence and claims (consider for example, courses such as history, philosophy and political science).

Missing co-premise: why does not doing better than Arts students imply that science teaching is ineffective?
```

Obvious rebuttal to missing co-premise invalidates original claim.
As a second example, consider the argument that establishing safe injecting rooms in Australia should cut the death rate for heroin addicts because they have done so in other countries.

This example illustrates two key principles of argument mapping:

1. Claims shouldn’t “pull rabbits out of a hat” (“Rabbit Rule”). i.e. every key term or concept in a claim should appear in at least one of the supporting premises. In this case, “Australia” was mentioned in the claim, but “other countries” was mentioned in the premise. Thus to complete the argument, a co-premise which links “other countries” and “Australia” is needed. This leads to the second key principle of argument maps.

2. Co-premises should “hold hands”. That is, every meaningful term in one premise of a reason must appear in another premise of that reason, or the conclusion. In this case, “other countries” is the term common to both the premises.

As a slightly more complex example, consider the following argument map for a research proposal.

Map created with the freeware, CompendiumNG. The commercial software, Rationale, provides specialised support for the creation of argument maps.
7. Tables

To compare and contrast two or more things, it helps if they are sitting next to each other. Consequently, to aid a comparison of various theoretical perspectives or approaches to doing something, the most useful form of graphic organiser is likely to be a table (though a mind map might be a useful tool for deciding on the various aspects or factors which will be compared in the table).

As a first example, consider the short oral essay by Lindy Edwards, *How to argue with an economist* (http://www.abc.net.au/radionational/programs/perspective/lindy-edwards/3220030), which compares and contrasts the values differences between three different industrial relations (IR) models we’ve had in Australia. One way the text of this oral essay could be organised to make it easier to learn or use in an assignment would be to excerpt the key points into the following table.

<table>
<thead>
<tr>
<th></th>
<th>Centralised Arbitration</th>
<th>Enterprise Bargaining</th>
<th>Individual Contracts</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Model Description</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Values Differences</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Worker quality of life vs business profits</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Protecting vulnerable vs giving go-getters flexibility</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Best way of dealing with conflict</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If you were evaluating different approaches to doing something, then a table something like the following might be very helpful.

<table>
<thead>
<tr>
<th></th>
<th>Approach 1</th>
<th>Approach 2</th>
<th>Approach 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>How does it work?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>What theory informs the approach?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>What resources are needed?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>How successful has it been?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Advantages?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Problems?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Potential barriers in your context?</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
8. Decision Trees

Decision trees provide a structured way of making decisions about a course of action. They work by getting you to answer a series of questions from broad to narrow, and depending on your answer, you get taken down different branches of the tree. As such, they can aid “diagnostic” processes in medicine and law, for example. The following example looks at part of a decision tree for deciding which elementary statistical test to use in which situation for normally distributed data.

### One

**Population Proportion**

- **One (testing claim about population)**

- **Number of Samples**

- **Population Proportions**

- **Two (Comparing two populations)**

- **Population Parameters (E.g. Height, IQ)**

- **Many**

- **ANOVA**

- **Population standard deviation known:** use $z = \frac{\hat{p} - \mu}{\sigma / \sqrt{n}}$

- **Population standard deviation unknown:** use $z = \frac{\hat{X} - \mu}{s / \sqrt{n}}$ if $n > 30$

Use $t = \frac{\hat{X} - \mu}{s / \sqrt{n}}$, $df = n - 1$ if $n \leq 30$

- **Independent samples**

- **Large samples ($n_1, n_2 > 30$): use** $z = \frac{\hat{X}_1 - \hat{X}_2}{\sqrt{s_1^2 / n_1 + s_2^2 / n_2}}$

- **Small samples: use** $t = \frac{\hat{X}_1 - \hat{X}_2}{s_p \sqrt{1/n_1 + 1/n_2}}$, $df = n_1 + n_2 - 2$

- **Dependent (paired) samples (E.g. Before and after study)**

- **Use** $t = \frac{\hat{X}_d - \mu_d}{s_d / \sqrt{n}}$, $df = n - 1$. $d$ is for “difference” (i.e. after result – before result)

More extensive statistical decision trees can be readily found on the web. A couple of nice ones are:

D.R. Rowland, The Learning Hub, The University of Queensland
9. Flowcharts

Flowcharts are used to break complex processes down into a series of smaller, more manageable steps, each of which may be somewhat complex in themselves, but more manageable. They can be used to schematically describe a complex system (e.g. [http://www.edwardsaquifer.net/treatme.html](http://www.edwardsaquifer.net/treatme.html)), or complex processes such as the assignment writing process illustrated below, or lengthy mathematical calculations. Another use is in writing computer program code, where the things the program has to accomplish are broken up into modules which can be written somewhat independently of the other modules. (Compare with breaking an oral presentation down into the points to be discussed on each of a sequence of PowerPoint slides. While trying to develop and remember the talk as a whole might be quite daunting, developing and remembering what to say about each individual slide is much less so.)

Managing the Writing Process

![Flowchart diagram](image)

Managing the Writing Process

- Do some preliminary background reading and/or review relevant theories and concepts from lectures and the textbook.
- Analyze topic
- Search library catalogue and databases
- Critically review relevant sources
- Develop a working thesis and main lines of argument. [Organise these with a mind map then outline.]
- Write draft
- Assess draft: any gaps / unanswered questions?
- “Polish” / revise draft. [Check in a logical order with a “table of paragraph contents” if didn’t write from a plan.]
- Proofread final version and double check you have completed all submission requirements.
- Submit

A flowchart like this can help you with time management. It is much easier to estimate how long each stage might take than it is to estimate how long completing an assignment from beginning to end might take without breaking things down.
Even if you don’t understand the mathematics of the example on this page, you should be able to appreciate the value of breaking such a long and complex calculation down into a series of sub-problems, each of which might take several lines of calculation to complete, but which should be fairly basic processes for students at the level this example is aimed at. Note also the conditional branching, a classic feature of a flowchart.

**POWER SERIES SOLUTIONS FLOW CHART (plus some theory)**

General 2nd order linear homogeneous d.e.:
\[ a_2(x)y'' + a_1(x)y' + a_0(x)y = 0 \]

Standard form:
\[ y'' + P(x)y' + Q(x)y = 0 \]

\[ P(x) \text{ and } Q(x) \text{ both analytic at } x_0? \]

\( \text{No} \) \rightarrow singular point

\( \text{Yes} \)

\( *x = x_0 \text{ is an ordinary point} \)

* There exists two lin. ind. solns. of form: \( y = \sum_{k=0}^{\infty} c_k (x - x_0)^k \)

* Series converge at least for \( |x - x_0| < R; R = \text{dist. from } x_0 \text{ to the nearest singular point, real or complex.} \)

WLOG, assume \( x_0 = 0 \)

Sub. \( y = \sum_{k=0}^{\infty} c_k x^k \) into the de

polynomial coefficients (Eg.2)

non-polynomial coefficients (Eg.3)

multiply series by coeffs.

Shift indices to get \( \sum_{k} a_k x^{k}\) everywhere

Expand coeff. fn. as a power series

Expand first few terms of all series and multiply out

collect terms in like powers of \( x \)

set coeffs. of \( x^0 \) equal to zero (\( \Rightarrow \) a recurrence relation)

Iterate coeffs. starting from arbitrary \( c_0 \) and \( c_1 \)

Sub. results in \( y = c_0 + c_1 x + c_2 x^2 + ... \)
Collect terms in \( c_0 \) and \( c_1 \) and rewrite as:
\[ y_1(x) = (1 + ...) \]
\[ y_2(x) = (x + ...) \]
